

ETIS

Team GitHub & Repository Setup Quickstart

Verify the correct team repository once, with the minimum GitHub access required

Audience

Student teams, repository owners, and organization members

Purpose

Complete the normal nomination -> GitHub authorization -> exact verification path safely and understand what to do when the path differs.

COMP 330/474 Software Engineering • Fall 2026 • Semester Start 2026 • August 23, 2026

EXECUTIVE OVERVIEW

One teammate nominates the real working repository. The personal owner or authorized organization grants selected-repository access. A student returns to ETIS and verifies that exact repository. Once verified, the repository binding is shared by the whole team.

1. Sign in & link GitHub

2. Nominate repo

3. Owner/admin
authorizes

4. Verify exact repo

5. Team is ready

DO NOT SKIP STEP 2

A pasted URL is only a candidate. GitHub authorization is only Step 1. The repository becomes trusted team evidence only after ETIS completes Step 2: Check & verify repository access.

Step	Do this	Do not do this
1	Sign in with Loyola. In My Team, confirm the GitHub account is the one you actually use.	Do not assume Loyola and GitHub identities are the same account.
2	Paste the complete HTTPS URL of the team's actual working repository and choose Nominate team repository.	.git is optional. Do not treat the pasted URL as trusted evidence yet.
3	On GitHub choose Only select repositories and choose only the nominated team repository.	Never choose All repositories. Never use a PAT for ETIS.
4	Return to My Team and choose Check & verify repository access.	Do not stop after GitHub authorization; Step 2 is required.
5	Confirm Verified team repository. Other teammates inherit the binding.	Do not have every teammate nominate a different URL.

The setup flow on screen

1. Nominate the team's actual working repository.

2. If GitHub organization authorization is required, complete/request Step 1.

3. On GitHub select Only select repositories, then choose only the nominated team repository.

4. Back in ETIS, complete Step 2: Check & verify repository access.

GITHUB SCOPE CHECK

The GitHub example intentionally does not show a repository name. Your selected repository must be the same one nominated in My Team. If you see an unrelated class/personal repository, stop and correct the selection before saving.

Personal vs. organization repositories

Repository type	Who authorizes	What students should do
Personal	The actual personal-repository owner.	If you are not the owner, wait for the owner. After verification, the team shares the binding.
Organization-owned	GitHub organization owner/admin if GitHub requires approval.	Follow GitHub's request/approval path. This is not automatically instructor approval unless the instructor actually has GitHub organization authority.

Fast troubleshooting

You see	Do this
Wrong GitHub account	My Team -> Change linked GitHub account. Then select the account you actually use for the team.
Step 1 locked	Complete/request owner or organization authorization first.
Step 1 complete, Step 2 pending	Click Check & verify repository access.
Verification fails	Confirm the GitHub App includes the exact nominated repository and uses selected-repository scope.
Wrong repo before verification	Use Repository wrong? Use a different repository.
Wrong repo after verification	Ask the Instructor/Course Owner to reset repository onboarding; then repeat the normal trust flow.
All repositories selected	Change the installation to Only select repositories. ETIS is designed to reject broad scope.
A teammate already verified it	Do nothing to the repository binding. Confirm it is correct, then continue to Engineering Evidence/Studio.

READY CHECK

Loyola identity ✓ Team assigned ✓ GitHub identity linked ✓ Verified team repository ✓

SECURITY RULE

ETIS repository access is read-only and selected-repository scoped. Never give ETIS a personal access token and never authorize All repositories.
